- Network Infrastructure
- VoIP Server Security
- Signalling Security
- Media Transport Security
- Cloud VoIP Solutions Security
- VoIP Client Security
- Capture the Flag

# Introduction

- Fatih Ozavci, Principal Security Consultant
- Interests
  - VoIP & \*Phreaking
  - Mobile Applications
  - Network Infrastructure
  - Embedded Devices
  - Hardware and IoT Hacking
- Author of Viproy VoIP Penetration Testing Kit
- Public Speaker and Trainer
  - Blackhat, Defcon, AusCert, Troopers, Ruxcon

- Chris Archimandritis - Senior Security Consultant
- Interests
  - VoIP and IMS Infrastructure
  - Mobile Applications
  - SAP Environment and Applications Security
  - Hardware Hacking
  - Network Infrastructure

## General assumptions:

- The VoIP Networks are isolated
- Hacking VoIP requires detailed knowledge
- Attacks target only privacy and toll fraud
- Pretending VoIP services are configured well

## Real life:

- Broken physical security, weak network auth
- After Viproy, no knowledge required anymore
- How about client attacks, intelligence and APT
- Default passwords, obsolete systems...

- VoIP Infrastructure, Network Design and Protocol Analysis
- Authorisation and Authentication Analysis  
Signalling Security Analysis for SIP and H.248
- Advanced Analysis of Business Functionality
- Transport Encryption Analysis
- Media Streaming and MITM Analysis
- Analysis of Essential and Supportive Services  
Management Services and Protocol Analysis
- Hosted/Cloud Services Analysis
- Call Centre Analysis

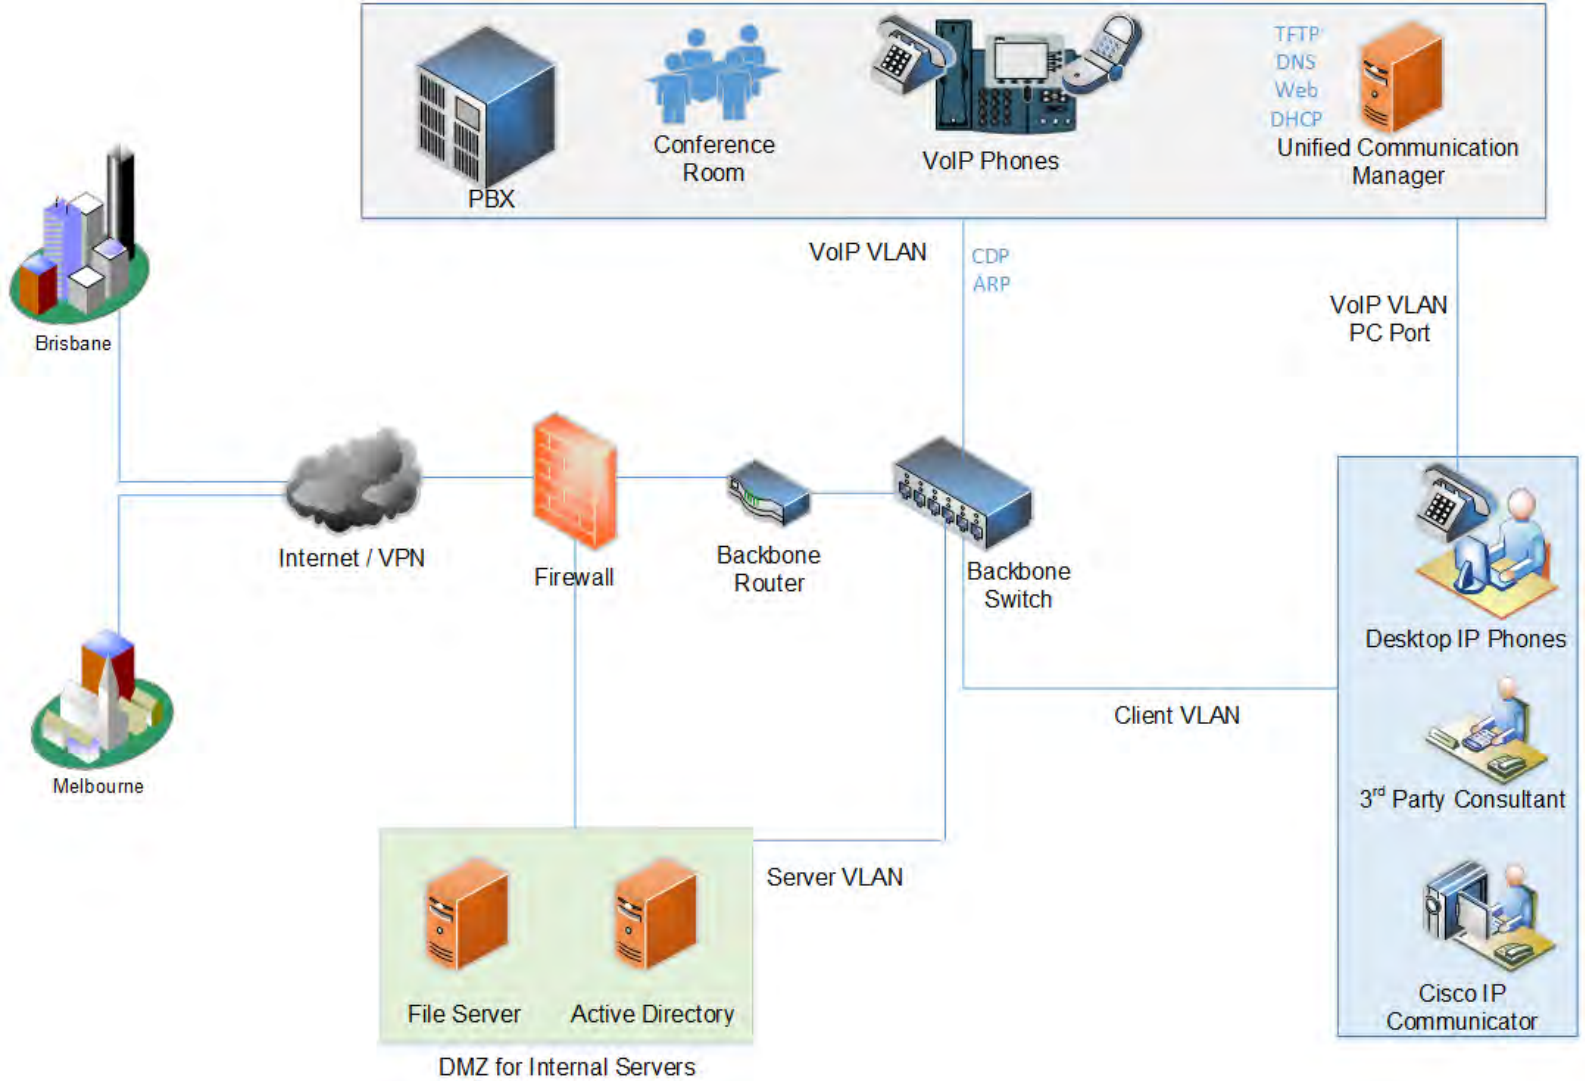

- Viproxy VoIP Penetration and Exploitation Kit
  - Testing modules for Metasploit Framework
  - SIP & Skinny libraries for the module development
  - SIP custom header and authentication support
  - Trust analyser, SIP proxy bounce, MITM proxy, Skinny
- Modules
  - SIP Options, Register, Invite, Message
  - SIP Brute Forcer, Enumerator
  - SIP trust analyser, SIP proxy, Fake service
  - Cisco Skinny analysers
  - Cisco CUCM/CUCDM exploits
  - MSRP Support, Fuzzing for SIP and SDP

- Skeleton for Feature Fuzzing, NOT Only SIP Protocol
- Multiple SIP Service Initiation
  - Call fuzzing in many states, response fuzzing
- Integration With Other Metasploit Features
  - Fuzzers, encoding support, auxiliares, etc.
- Custom Header Support
  - Future compliance, vendor specific extensions, VAS
- Raw Data Send Support (Useful with External Static Tools)
- Authentication Support
  - Authentication fuzzing, custom fuzzing with authentication
- Less Code, Custom Fuzzing, State Checks
- Some Extra Features (Fuzz Library, SDP, MSRP)

# Network Infrastructure

# Corporate VoIP Infrastructure

# Unified Communications Services

# Hosted/Cloud VoIP Services

### Sandbox for Tenant Services

SIP, RTP, HTTP

Shared Switch ?

Cisco Unified Communication Manager  
Skinny / SIP / TFTP / HTTP

Firewall

### Shared Services for All Tenants

## Plan

- Identifying the network design issues
- Unauthorised access to the Voice LAN/WAN
- Attacking network services
- Persistent access

## Goals

- Persistent unauthorised network access
- Mass compromise of clients and services
- Eavesdropping

- Discover VoIP network configuration, design and requirements
- Find Voice VLAN and gain access
- Gain access using PC port on IP Phone
- Understanding the switching security for
  - Main vendor for VoIP infrastructure
  - Network authentication requirements
  - VLAN ID and requirements
  - IP Phone management services
- Persistent access

- Client Types
  - Soft phones (IP Communicator, Android/iOS Apps)
  - IP phones and handsets (Cisco 7945, Yealink)
  - Video conference equipment (Cisco Presence)
  - External meeting services (Webex, GoMeeting)
- Service Purpose
  - International/National landline/Cell endpoints
  - Call centre (commercial vs Open Source)
  - Commercial VoIP services (mobile, hosted)
  - Internal usage (VLAN, conference rooms)
- VoIP protocols (Skinny, SIP, RTP, IAX, H.323)

- Local Area Network
  - Voice VLAN usage (protected, authenticated)
  - Network segmentation (computers vs VoIP)
  - Supportive services (CDP, DHCP, TFTP, HTTP, SNMP)
- Wide Area Network
  - Connection types (routers, VPNs, landline)
  - Bottlenecks vs QoS requirements
  - Service trusts and trunk usage
- Primary Concerns for Commercial Services
  - Service contingency requirements
  - Denial of Service targets

- Local distribution rooms and infrastructure
- Network termination and endpoint facilities

## f | NBN alternative: Is Australia's copper network fit for purpose?

BY NICK ROSS

ABC TECHNOLOGY AND GAMES : UPDATED 20 SEP 2013  
(FIRST POSTED 19 SEP 2013)

→ | COMMENTS (112)

In the world of political and media misinformation that is the NBN, an important issue, that hasn't been fully addressed, is "How fit for purpose is Australia's copper network?" This seemingly mundane and tedious question directly affects tens of billions of dollars in government spending. How?

The bulk of the Coalition's NBN alternative policy uses the existing copper network to get the internet to your home or

There is considerable evidence to suggest that Australia's copper network is in a worse state than those of other nations. How bad is it and can it be fixed?  
CREDIT: MAGILLA (CANOFWORMS.ORG)

- Meeting room and lobby phones, conference devices, emergency phones
  - PC ports, Power Over Ethernet
  - Raspberry Pi
  - Permanent access with 4G

- Attack Types
  - PC Ports of the IP phone and handsets
  - CDP sniffing/spoofing for Voice VLAN
  - DTP and VLAN Trunking Protocol attacks
  - ARP spoofing for MITM attacks
  - HSRP spoofing for MITM attacks
  - DHCP spoofing & snooping
- Persistent access
  - Tapberry Pi (a.k.a berry-tap)
  - Tampered phone + PoE
  - 3G/4G for connectivity

- IP Phones have a PC Port for desktop usage
  - CDP spoofing is not required
  - VLAN setting is not required
  - DTP spoofing is not required
- 
- Authentication of IP Phones
    - 802.1x - using Hub to bypass
    - EAP-MD5 dictionary attack

# How to make your own Tapberry Pi

RJ45 Connection Pins

# How to make your own Tapberry Pi

Patch the Cat5 cable

Speaker Power

- Discovering Cisco devices
- Learning Voice VLAN
- Tools
  - Wireshark
  - VoIP Hopper
  - CDP-tools
  - Viproy CDP module
- Sniffing to learn the network infrastructure
- Sending a spoofed CDP packet as an IP Phone to get access to the Voice VLAN
- Connect to the Voice VLAN (802.1x, EAP-MD5)

No.	Time	Source	Destination	Protocol	Length	Info

- Adding the Voice VLAN
  - max 4094 VLANs for Cisco, can be brute-forced
  - Linux
    - vconfig add eth0 VLANID
    - dhclient eth0.VLANID
  - Mac OS X
    - Settings -> Network -> Manage Virtual

- ARP Scan
- ARP Spoofing
- MITM Attack
  - Hijacking
  - SSL
  - SSH keys
  - Rogue service
- Tools
  - Cain & Abel
  - Ettercap
  - Dsniff

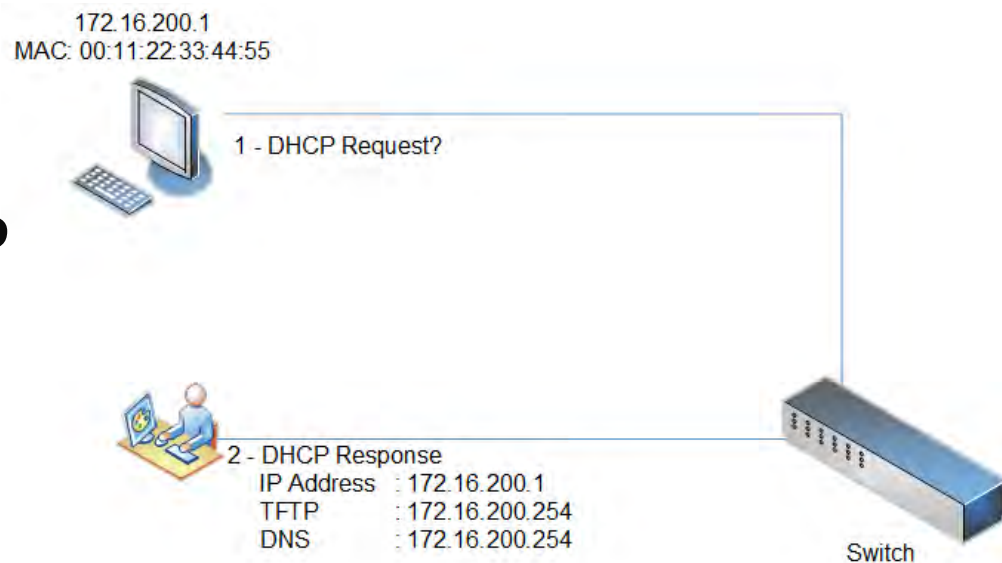

- ARP Scanning
  - Find MAC and IPs to guess names of configuration files stored on TFTP/HTTP servers
  - SIP/Skinny authentication with MAC address
- ARP Spoofing and being the ...
  - TFTP server (configuration, updates, SSH keys)
  - DNS server
  - Web server (management, IP phone services)
  - SIP/Skinny server/Proxy
  - RTP proxy
- MAC based filtering and authentication

- DHCP Sniffing

- Finding IP range
- Finding TFTP/HTTP
- Finding DNS

- DHCP Spoofing

- Suspend the DHCP server
  - DHCP consumption (request all IP addresses)
- Become a Rogue DHCP Server
- Send spoofed DHCP responses to the IP phones
  - Custom TFTP and DNS server

- VoIP networks generally use TFTP servers for configuration, update, certificate, SSH keys management. (Web servers may be in use)
  - Obtaining configuration files for MAC addresses
    - SEPDefault.cnf, SEPXXXXXXXXXXXXX.cnf.xml
    - SIPDefault.cnf, SIPXXXXXXXXXXXXX.cnf.xml
  - Identifying SIP, Skinny, RTP and web settings
  - Finding IP phones software versions and updates
  - Configuration files may have username/passwords
  - Digital signature/encryption usage for files
  - Tools: TFTPTheft, Metasploit

```
<deviceProtocol>SCCP</deviceProtocol>
```

```
<sshUserId></sshUserId>
```

```
<sshPassword></sshPassword>
```

```
<webAccess>1</webAccess>
```

```
<settingsAccess>1</settingsAccess>
```

```
<sideToneLevel>0</sideToneLevel>
```

```
<spanToPCPort>1</spanToPCPort>
```

```
<sshAccess>1</sshAccess>
```

```
<phonePassword></phonePassword>
```

reg.1.address="3047"

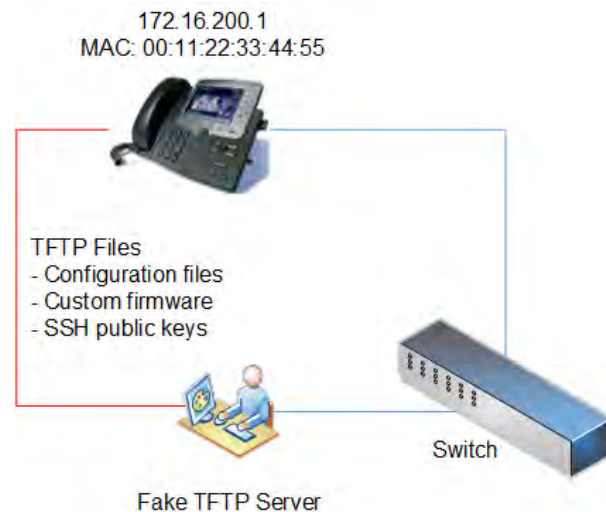

reg.1.label="3047"

reg.1.auth.userId="7d5b905ecc1b1efa7077868  
70276a940"

reg.1.auth.password="d9429ad54c3ee623f6e2  
0ae39de758ee"

divert.fwd.1.enabled="0"

- Send fake IP addresses for ...
  - HTTP server
  - IP phones management server
  - SIP server and proxy
  - Skinny server
  - RTP server and proxy

- Deploy SSH public keys for SSH on IP Phones
- Update custom settings of IP Phones
  - Null ring, custom alerts
- Deploy custom OS update and code execution

- SNMP protocol
  - UDP protocol, IP spoofing, no encryption
- Authentication
  - Community name (public, private, cisco)
  - SNMPv3 username/password attacks
- SNMP Software
  - SNMP management software vulnerabilities
  - Buffer overflows, memory corruptions
- Practical Attacks
  - Device configuration download and upload
  - Information gathering, code execution

- Secure network design
- Secure network infrastructure
  - DHCP snooping protection
  - ARP Spoofing protection
  - 802.1x for Voice VLANs
- Using secure network protocols
  - TFTP -> FTP+SSL or HTTPS
  - Telnet -> SSH
  - SNMP v1 v2c -> SNMP v3 with authentication
- Using digital signature and encryption for software updates and configuration

# VoIP Server Security

- Signalling servers and devices
- Media gateways
- SIP and RTP Proxies
- IP phones

## Plan

- Discover the VoIP servers and devices
- Identify insecure software and management
- Exploit the identified vulnerabilities

## Goals

- Persistent unauthorised server access
- Mass compromise of clients and services
- Persistent call and toll fraud attacks
- Voice recordings, CDR, VAS services

- Looking for
  - Signalling servers (e.g. SIP, Skinny, H.323, H.248)
  - Proxy servers (e.g. RTP, SIP, SDP)
  - Contact Centre services
  - Voicemail and email integration
  - Call recordings, call data records, log servers
- Discovering
  - Operating systems, versions and patch level
  - Management services (e.g. SNMP, RDP, Telnet, HTTP, SSH)
  - Weak or default credentials

- NMAP
  - Port scanning, service identification
  - `# nmap -sS -sV -A -p1-65535 192.168.1.1/24`
- Metasploit Framework
  - Viproy modules to discover VoIP services
  - UDP, ARP, SNMP, SSH, telnet discovery modules
  - Brute-force and enumeration modules
- Commercial & Open Source Vulnerability Scanners
  - Nessus, Qualys, Nexpose, OpenVAS

## Nmap scanning for service identification

```
# nmap -sS -sV -O -F -n -PO 192.168.2.104
```

```
Starting Nmap 4.62 ( http://nmap.org ) at 2009-03-12 14:22 EET
```

```
Interesting ports on 192.168.2.104:
```

```
Not shown: 1275 closed ports
```

```
PORT      STATE SERVICE VERSION
```

```
21/tcp    open  ftp      Trolltech Troll-FTPd
```

```
23/tcp    open  telnet   NASLite-SMB/Sveasoft Alchemy firmware telnetd
```

```
MAC Address: 00:40:5A:17:DF:49 (Goldstar Information & COMM.)
```

```
Device type: switch
```

```
Running: Cisco embedded
```

```
OS details: Cisco MDS 9216i switch
```

```
Uptime: 0.085 days (since Thu Mar 12 12:21:16 2009)
```

```
Network Distance: 1 hop
```

```
Service Info: Host: lgvp; OS: Linux
```

```
OS and Service detection performed. Please report any incorrect results at  
http://nmap.org/submit/ .
```

```
Nmap done: 1 IP address (1 host up) scanned in 18.623 seconds
```

- Operating system vulnerabilities
  - Obsolete software
  - Missing security patches
  - Vulnerable 3<sup>rd</sup> party libraries
- Embedded system and hardware attacks
  - Unauthorised physical access
- Insecure configuration and management
  - Insecure management services and software
  - Default credentials and settings
- Insecure network services (TFTP, FTP, HTTP)
- Insecure web applications (Log, Reporting)

- VoIP Service Suites
  - Cisco Product Family (e.g. CUCM, VOSS)
  - Alcatel-Lucent Product Family (e.g. Opentouch X )
  - Avaya Product Family (e.g. Contact Centers)
- SIP Servers
  - SIPXecs, Asterisk, FreeSwitch, Kamalio, FreePBX
- Gateways
  - Proxy appliance, Media gateway
- Database Servers
- Management Software
  - HP & Dell management, Tivoli, Solarwinds

- Bourne Again Shell (BASH) allows users to execute unauthorised commands through the concatenated commands.
- It can be remotely exploited through the network services such as HTTP, DNS and SIP
- Major vendors and projects are affected
  - Asterisk, FreePBX, Cisco, Avaya, Embedded devices

CVE-2014-6271, CVE-2014-6277, CVE-2014-6278,  
CVE-2014-7169, CVE-2014-7186, CVE-2014-7187

## **CVE-2014-7187**

```
(for x in {1..200} ; do echo "for x$x in ; do :"; done; for x in {1..200} ; do echo done ; done) | bash || echo "CVE-2014-7187 vulnerable, word_lineno"
```

## **CVE-2014-6278**

```
env X='() { _; } >_[${$()}] { echo CVE-2014-6278 vulnerable; id; }' bash -c :
```

## **CVE-2014-6277**

```
env X='() { x() { _; }; x() { _; } <<a; }' bash -c :
```

- OpenSSL allows users to extract arbitrary information remotely from the server memory.
- It can be remotely exploited through the heartbeat enabled HTTPS connections if the web server is compiled with OpenSSL.
- Major vendors and projects are affected
  - Asterisk, FreePBX, Cisco, Avaya, Embedded devices

CVE-2014-0160

# Major Vulnerabilities: Heartbleed

## HOW THE HEARTBLEED BUG WORKS:

# Major Vulnerabilities: Heartbleed

# Major Vulnerabilities: Heartbleed

- Implement a security update procedure
  - Subscribe to the vendor announcements
  - Implement all security fixes ASAP
  - Servers, appliances, IP phones
- User secure management protocols
  - Strong authentication and password policy
  - Strong encryption (disable SSL and weak algorithms)
  - Secure management protocols (e.g. HTTPS, SSH)
- Use a monitoring and integrity checking system to avoid backdoors

# Signalling Security

VoIP = Signalling + Media

- Signalling services are responsible to initiate, track, transfer, record (CDR) and terminate VoIP calls.
- Multimedia transfer is a feature NOT provided by signalling services. (except H.323 and IAX2)
- Major signalling protocols
  - SIP + Vendor Extensions e.g. Cisco, Microsoft
  - Cisco Skinny Call Control Protocol (SCCP / Skinny)

## Plan

- Discovering signalling services
- Authentication and authorisation analysis
- Bypass tests for call restrictions and billing
- Server load analysis

## Goals

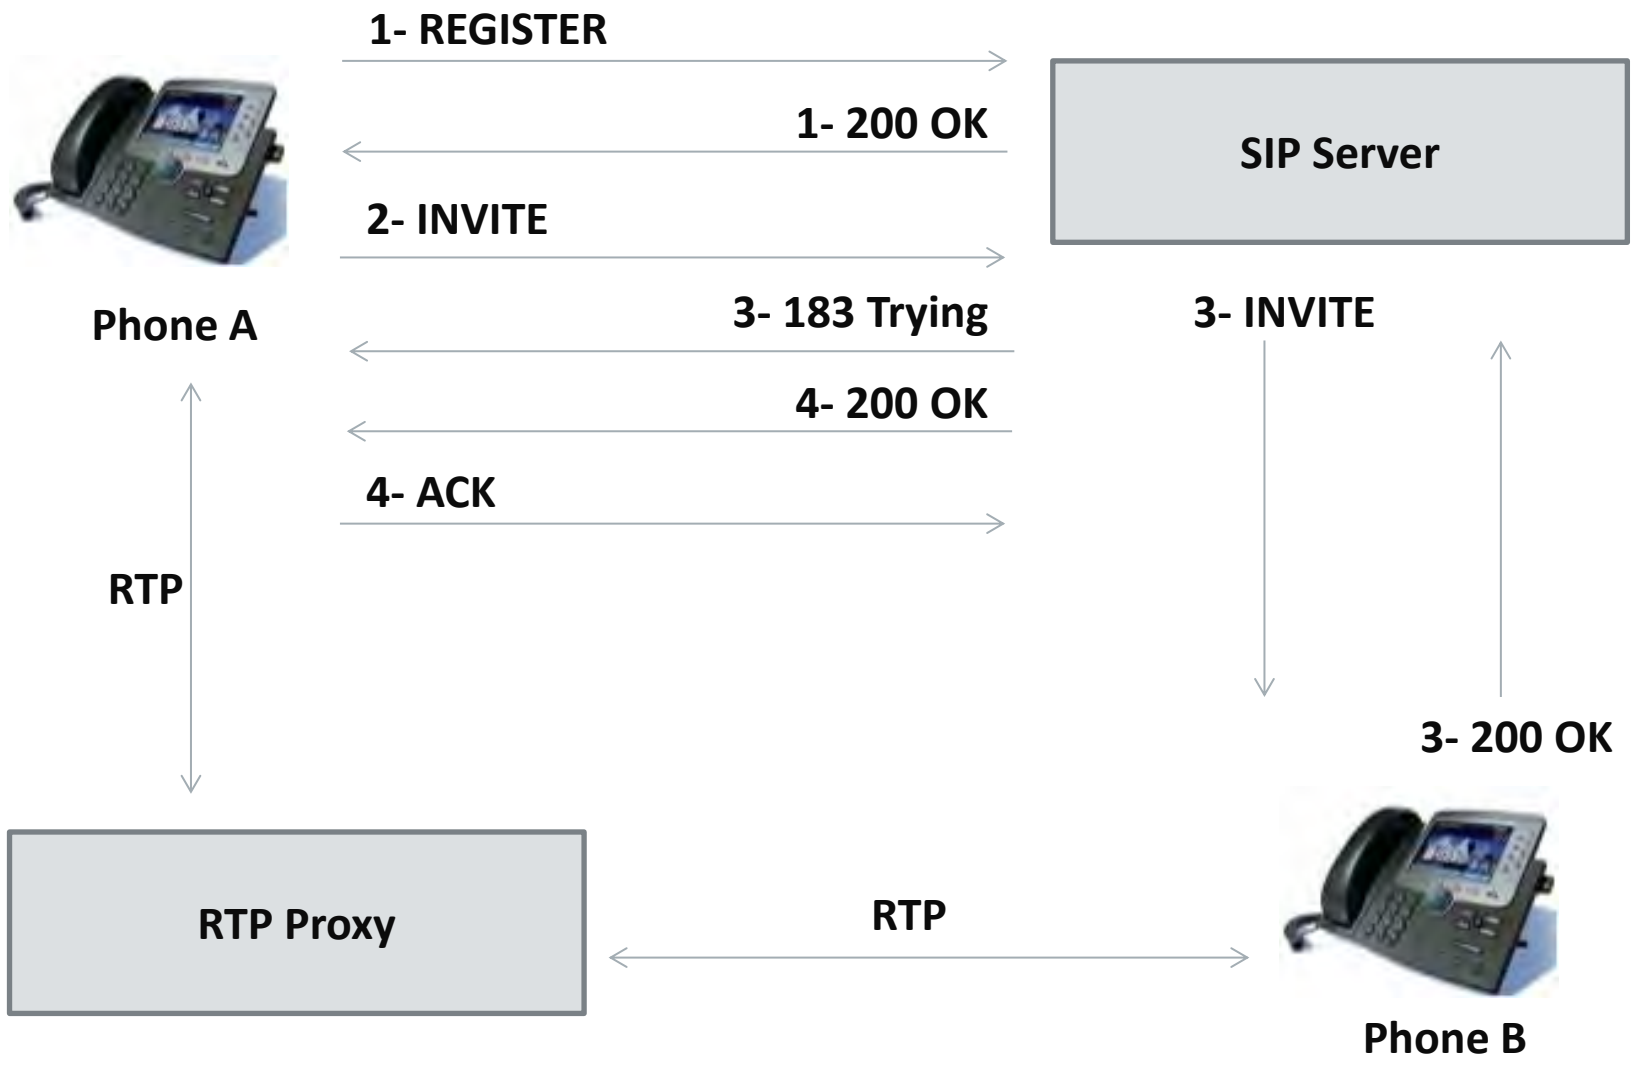

- Call and toll fraud
- Compromising the billing system
- Blackmail using TDoS and DoS

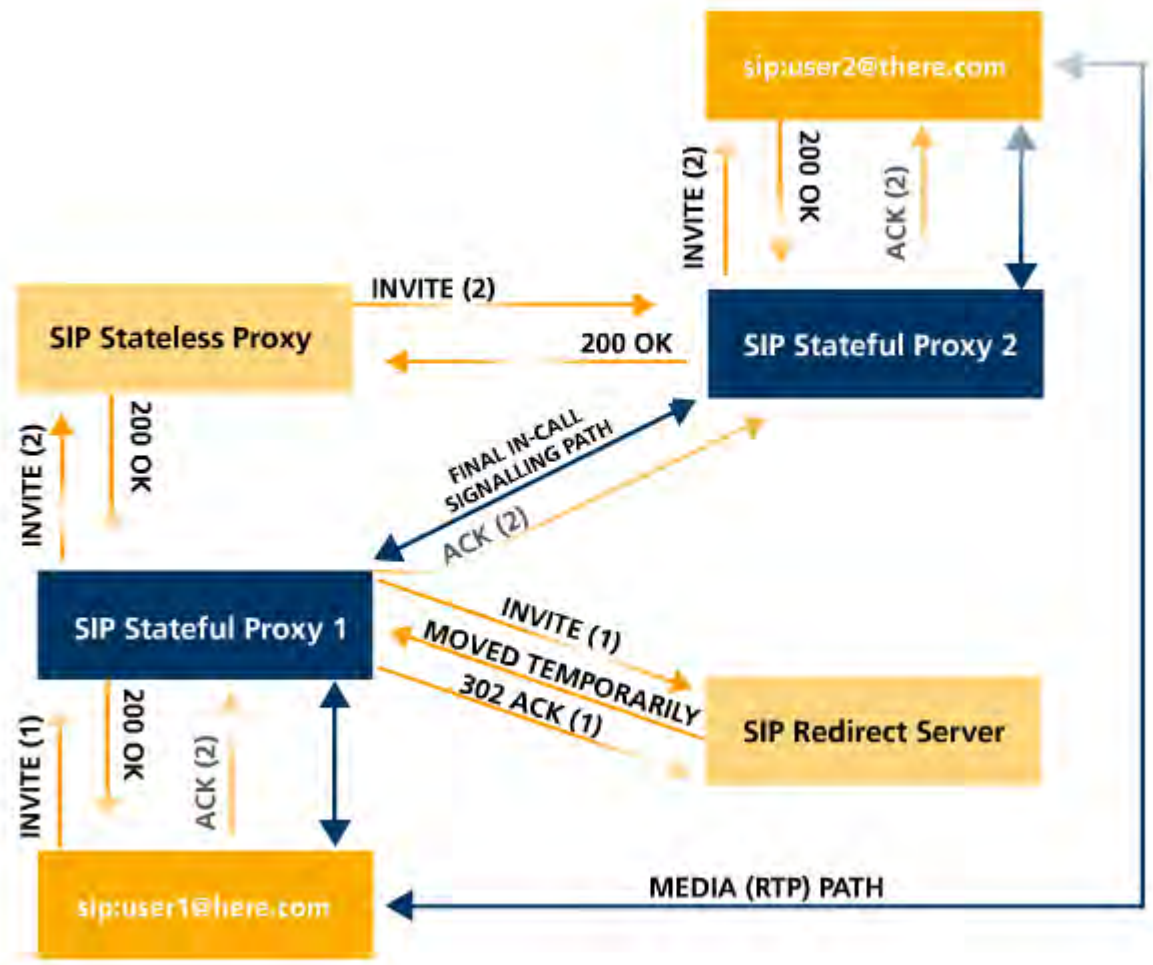

# SIP Signalling

- It was developed in 1996, standardised in 2002
- Signalling methods
  - Register
  - Invite
  - Subscribe
  - Message
- Encryption is required to protect RTP, message contents and credentials
- Authentication
  - Digest, Digital Certificate, NTLM, Kerberos
- Unified Communications

# Basic SIP Flow

# Less Complicated SIP Flow

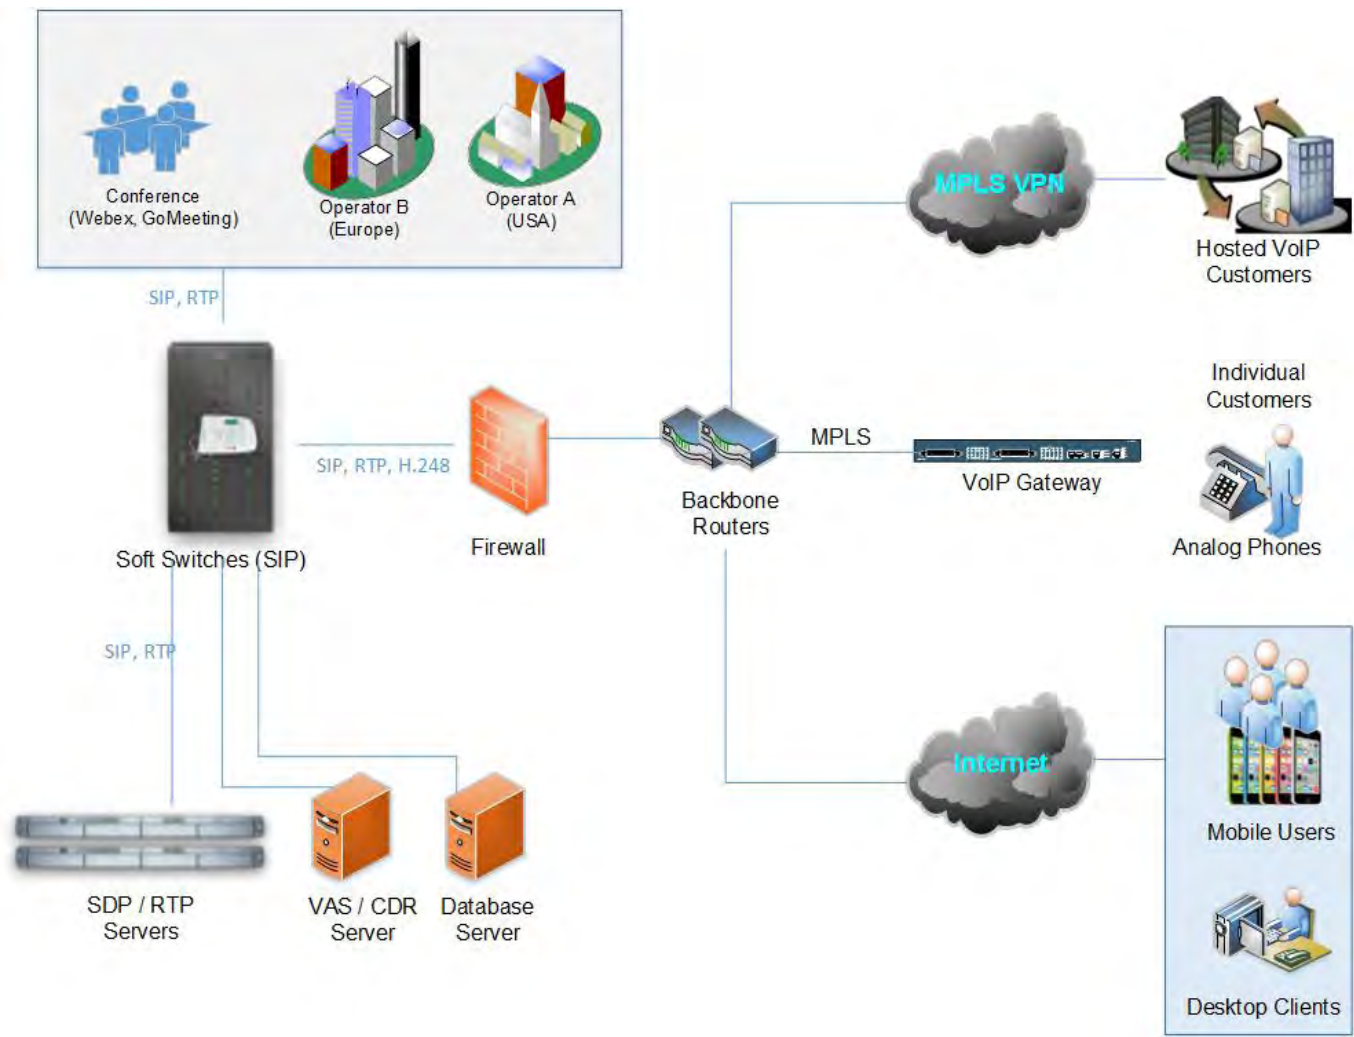

- Forget TDM and PSTN
- SIP, Skinny, H.248, RTP, MSAN/MGW
- Smart customer modems & phones
  
- Cisco UCM , Asterisk, Avaya, FreeSwitch
  - Linux operating system
  - Web based management services
  - VoIP services (Skinny, SIP, RTP)
  - Essential network services (TFTP, DHCP)
  - Call centre, voicemail, value added services

# Corporate VoIP Infrastructure

# Unified Communications Services

- Essential analysis
  - Registration and invitation analysis
  - User enumeration, brute force for credentials
  - Discovery for SIP trunks, gateways and trusts
  - Caller ID spoofing (w/wo register or trunk)
- Advanced analysis
  - Finding value added services and voicemail
  - SIP trust hacking
  - SIP proxy bounce attack

We are looking for...

- Finding and identifying SIP services and purposes
- Discovering available methods and features
- Discovering SIP software and vulnerabilities
- Identifying valid target numbers, users, realms
- Unauthenticated registration (trunk, VAS, gateway)
- Brute-forcing valid accounts and passwords
- Invite without registration
- Direct invite from special trunk (IP based)
- Invite spoofing (with/without register, via trunk)

- Finding and Identifying SIP Services
  - Different ports, different purposes
  - Internal Communication Service or PSTN Gateway
- Discovering Available Methods
  - Register, Direct Invite, Options
  - Soft switch, Call Manager, mobile client software, IP phone
- Discovering SIP Software
  - Well-known software vulnerabilities
  - Software compliance and architecture
  - Network endpoints and 3rd party detection

# Invite, CDR and Billing Tests

Invite / Ack / Re-Invite / Update (FROM, TO, VIA, Credentials)

100 Trying  
183 Session Progress  
180 Ringing  
200 OK

401 Unauthorized  
403 Forbidden  
404 Not Found  
500 Internal Server Error

## RESPONSE Depends on Information in INVITE REQUEST

- FROM, TO, Credentials with Realm, FROM <>, TO <>
- Via, Record-Route
- Direct INVITE from Specific IP:PORT (IP Based Trunks)

## Actions/Tests Depends on RESPONSE

- Brute Force (FROM&TO) for VAS and Gateways
- Testing Call Limits, Unauthenticated Calls, CDR Management
- INVITE Spoofing for Restriction Bypass, Spying, Invoice
- ....

- Cisco UCM accepts MAC address as identity
- No authentication (secure deployment?)
- Rogue SIP gateway with no authentication
- Caller ID spoofing with proxy headers
  - Via field, From field
  - P-Asserted-Identity, P-Called-Party-ID
  - P-Preferred-Identity
  - ISDN Calling Party Number, Remote-Party-ID\*
- Billing bypass with proxy headers
  - P-Charging-Vector (Spoofing, Manipulating)
  - Re-Invite, Update (With/Without P-Charging-Vector)

\* <https://tools.cisco.com/bugsearch/bug/CSCuo51517>

## Remote-Party-ID header

Remote-Party-ID: <sip:007@1.2.3.4>;party=called;screen=yes;privacy=off

- Caller ID spoofing
- Billing bypass
- Accessing voicemail
- 3rd party operators

- Telecom operators trust source Caller ID
- One insecure operator to rule them all

192.168.1.146  
Melbourne

192.168.1.202  
Brisbane

SIP based DoS attacks

- UDP vulnerabilities and IP spoofing
- Too many errors, very very verbose mode
- ICMP errors

Alderaan

- NGN/UC SIP Services Trust Each Other
  - Authentication and TCP are slow, they need speed. UDP is the solution.
  - IP and port based trust is most effective way
- What We Need
  - Target number to call (cell phone if service is public)
  - Tech magazine, web site information, news  
**Hacme Telecom** proudly announces the new cheap call services supported by **OverSeas Telecom**.

## Steps:

- Finding Trusted SIP Networks (Mostly B Class)
- Sending IP Spoofed Requests from Each IP:Port
- Each Call Should Contain IP:Port in "From" Section
- If We Have a Call, We Have The Trusted SIP Gateway IP and Port
  
- Initiate unauthorised calls after obtaining the trusted IP:Port pair

```

# Hacking SIP Trust Relationships

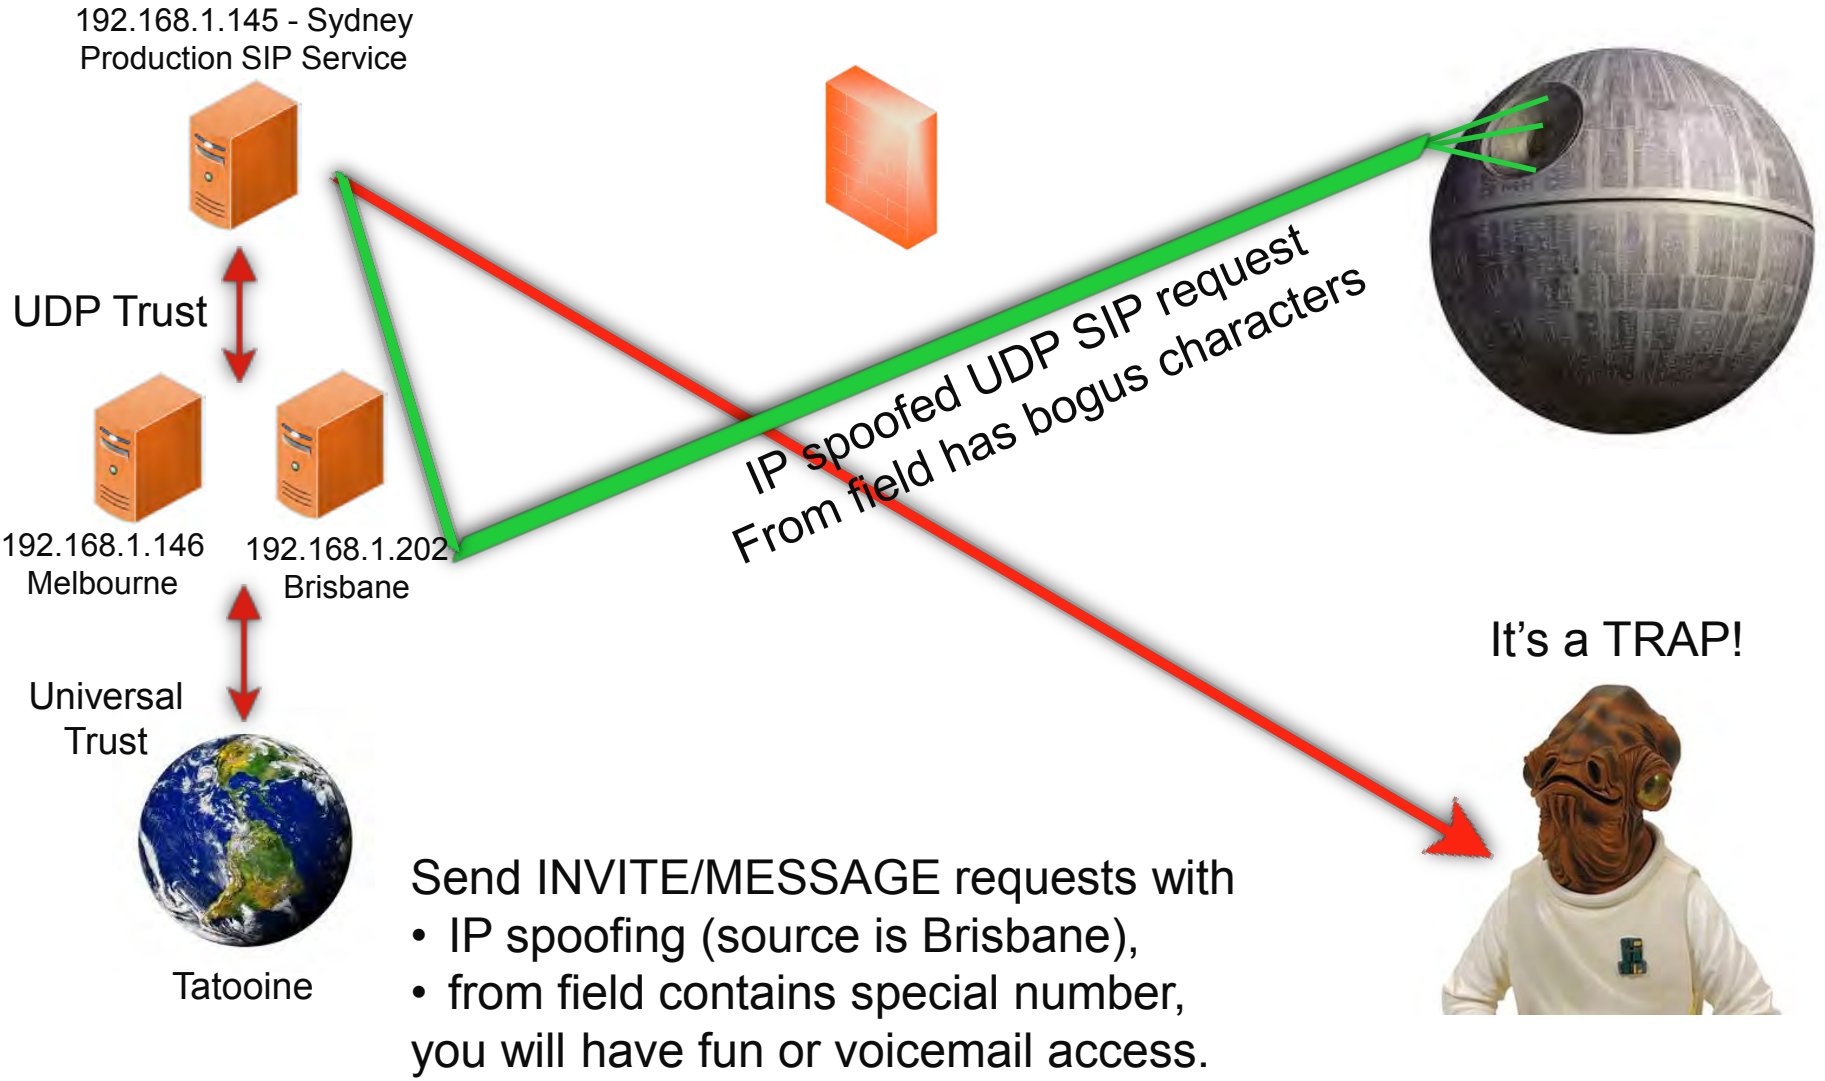

Send INVITE/MESSAGE requests with

- IP spoofing (source is Brisbane),
- from field contains Spoofed IP and P

the caller ID will be your trusted host.

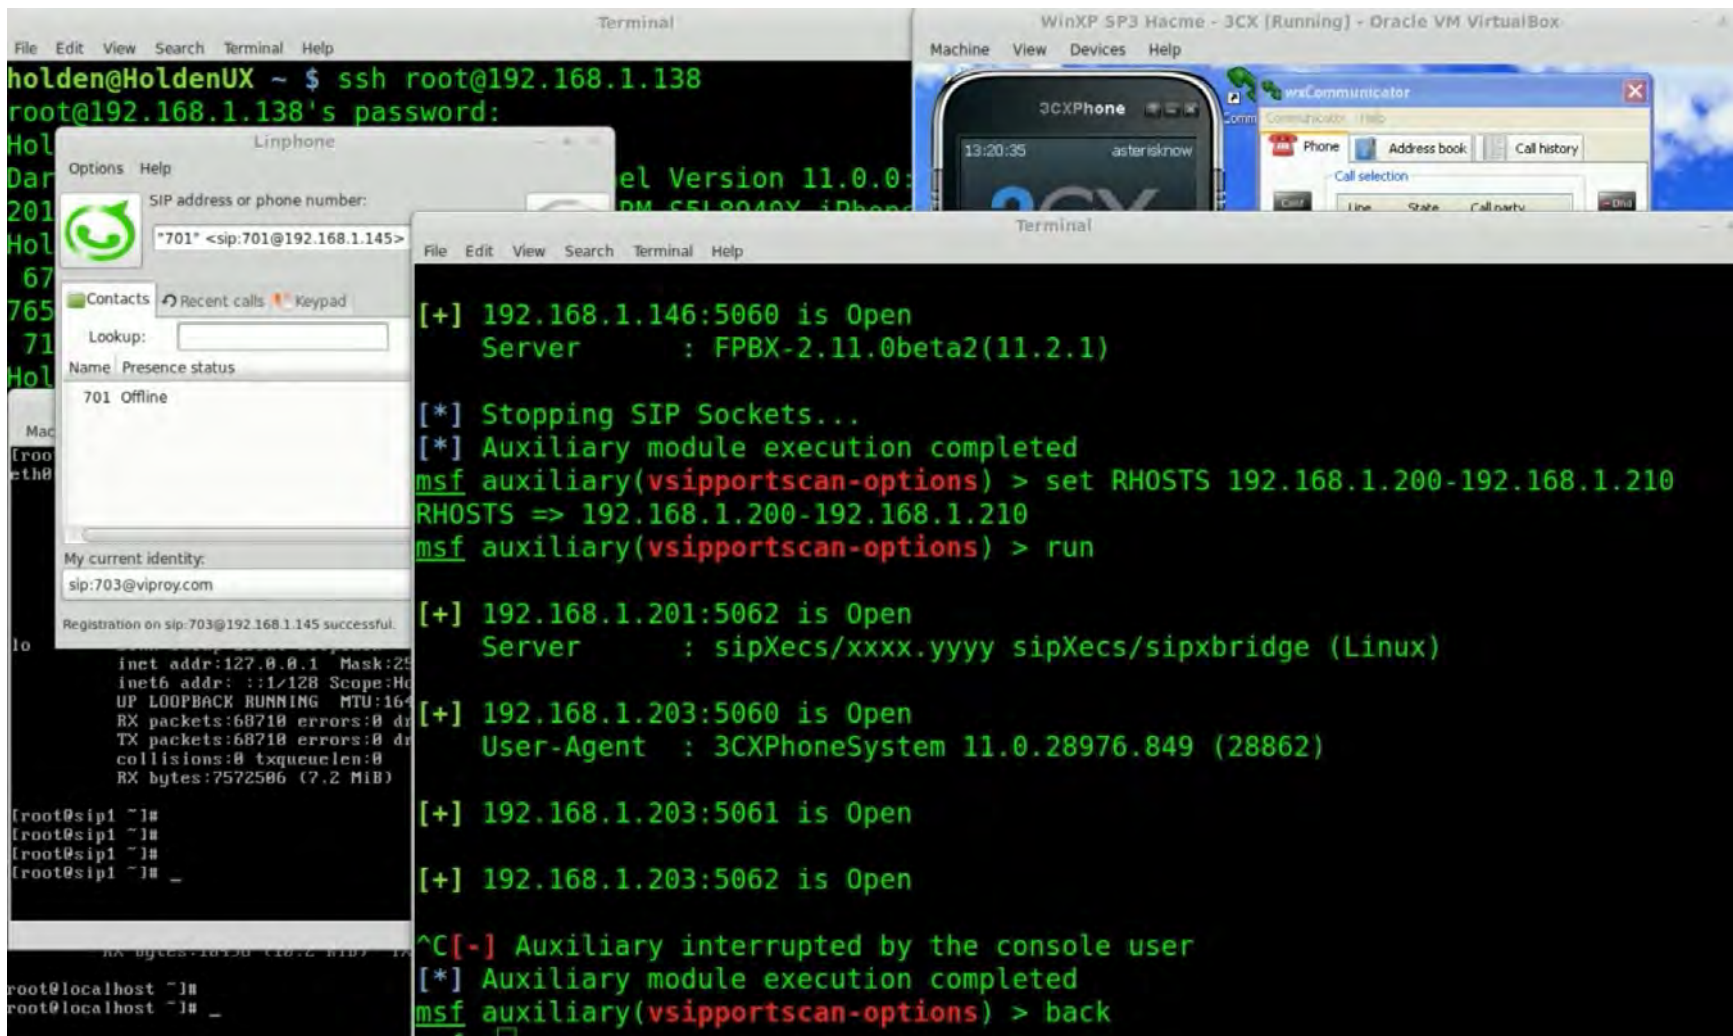

# Attacking a client using SIP trust

- Denial of Service
  - Calling all numbers at same time
  - Overloading SIP server's call limits
  - Overloading VAS service or international limits
  - Overloading CDR records with spoofed calls
- Short Message Service and Billing Attacks
- Attacking Server Software
  - Crashing/exploiting inaccessible features
  - Call redirection (working on it, not yet :/)
- Attacking a Client?

- Fuzzing as a SIP Client | SIP Server | Proxy | MITM
- SIP Server Software
- SIP Clients
  - Hardware devices, IP phones, Video Conference systems
  - Desktop application or web based software
  - Mobile software
- Special SIP Devices/Software
  - SIP firewalls, ACL devices, proxies
  - Connected SIP trunks, 3rd party gateways
  - MSAN/MGW
  - Logging software (indirect)
  - Special products: Cisco, Alcatel, Avaya, ZTE...

- Request Fuzzing
  - SDP features
  - MIME type fuzzing
- Response Fuzzing
  - Authentication, Bogus Messages, Redirection
- Static vs Stateful
- How about Smart Fuzzing
  - Missing state features (ACK, PHRACK, RE-INVITE, UPDATE)
  - Fuzzing after authentication (double account, self-call)
  - Response fuzzing (before or after authentication)
  - Missing SIP features (IP spoofing for SIP trunks, proxy headers)
  - Numeric fuzzing for services is NOT memory corruption
  - Dial plan fuzzing, VAS fuzzing

- Implement the secure deployment of Cisco
  - Digital certificate based authentication
  - Signature for updates and configuration files
  - Encrypt the configuration files
- Don't allow concurrent connections
- Install the IP phone and software updates

# Media Transport Security

- Media transport is essential for the VoIP communications (audio and video) and RTP is in charge for years.
- Real-time Transfer Protocol (RTP)
  - Highly vulnerable to MITM attacks
  - Encryption is not enabled on many implementations
  - It can be recorded and decoded easily
  - Codecs may change based on the implementation
  - DTMF tones are coded separately as RTP events
- RTP Control Protocol (RTCP) may be in use for monitoring and QoS

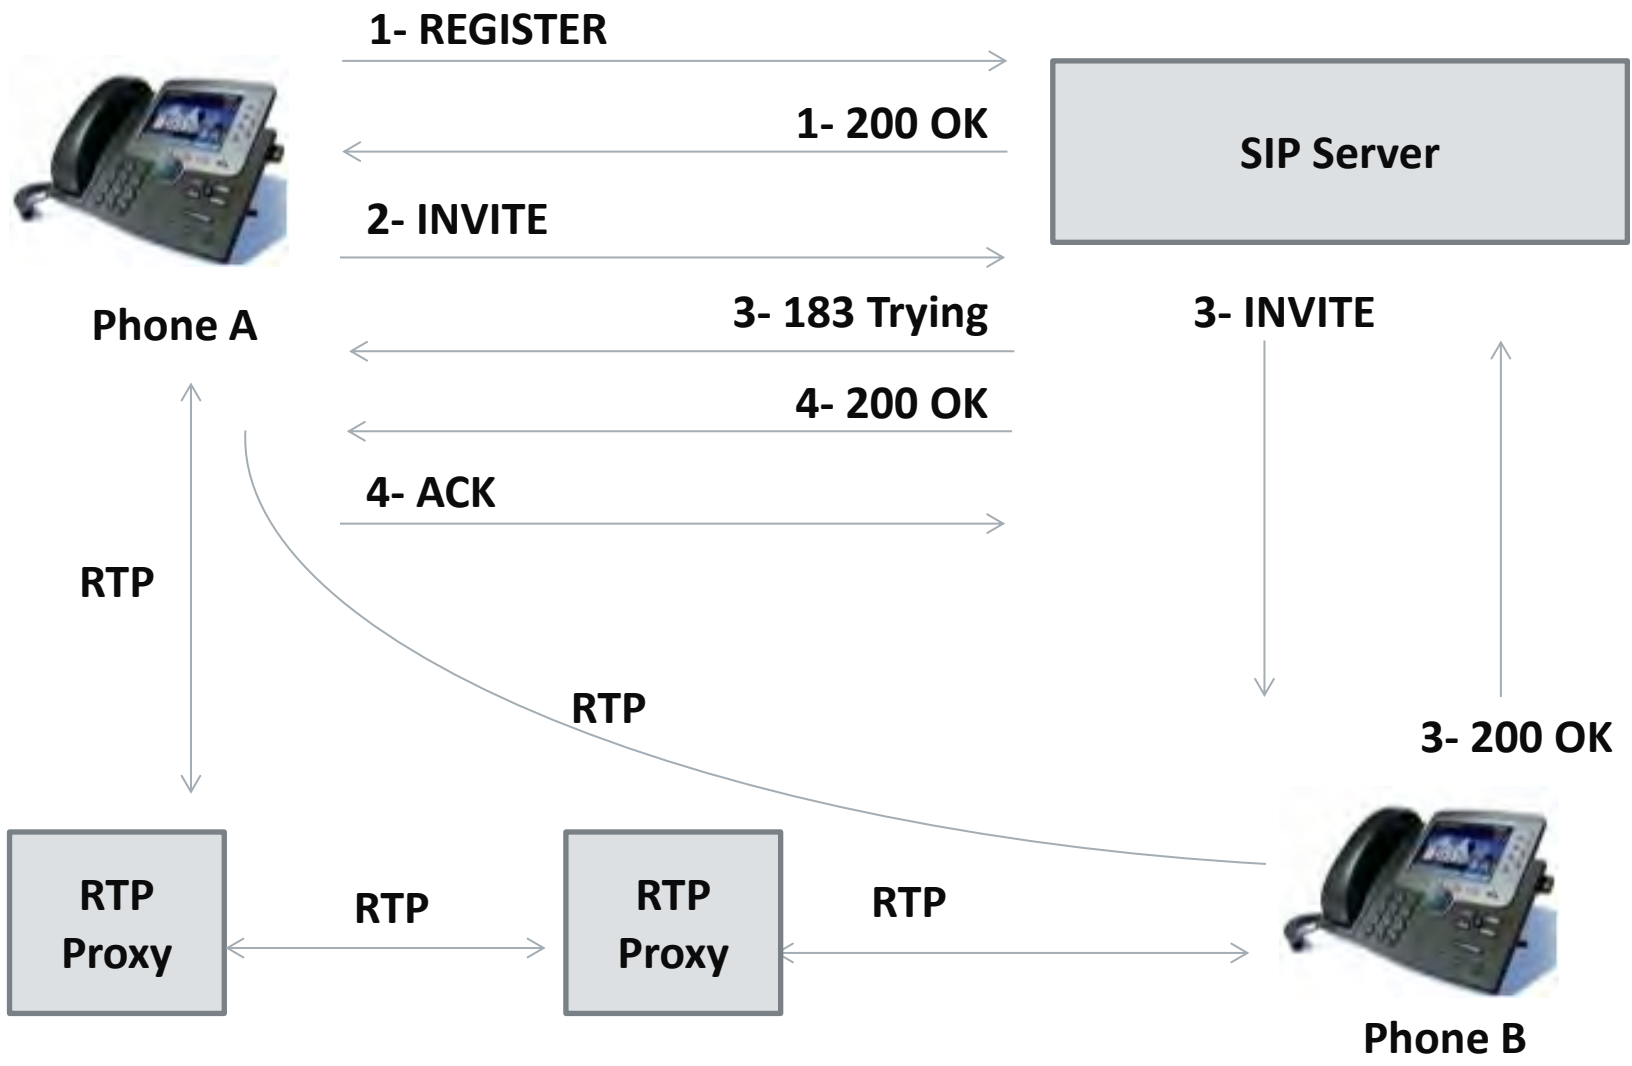

## Plan

- Performing the MITM attacks
- Obtaining unauthorised access to the media transport
- Decoding the RTP stream to extract the raw audio/video of the conversation

## Goals

- Eavesdropping
- Injection audio or video to the conversations

# Media Transport Flow

Wireshark: RTP Streams

Detected 12 RTP streams. Choose one for forward and reverse direction for analysis

Select a forward stream with left mouse button, and then  
Select a reverse stream with Ctrl + left mouse button

Unselect | Find Reverse | Save As | Mark Packets | Prepare Filter | Copy | Analyze | Close

Find reverse will find both RTP streams (sender / receiver).  
Analyse can analyse the spectrum, Save as can save the streams.

- ▼ Real-Time Transport Protocol
  - [Stream setup by SDP (frame 3402)]
  - 10.. .... = Version: RFC 1889 Version (2)
  - ..0. .... = Padding: False
  - ...0 .... = Extension: False
  - .... 0000 = Contributing source identifiers count: 0
  - 1... .... = Marker: True
  - Payload type: telephone-event (101)
  - Sequence number: 15163
  - [Extended sequence number: 80699]
  - Timestamp: 2060441025
  - Synchronization Source identifier: 0x6527584e (1697077326)
  - ▼ RFC 2833 RTP Event
    - Event ID: DTMF Six 6 (6)
    - 0... .... = End of Event: False
    - .0.. .... = Reserved: False
    - ..00 1010 = Volume: 10
    - Event Duration: 160

DTMF tones are encoded through the RTP events.

- Secure Real-time Transfer Protocol (SRTP)
  - Encryption
  - Message Authentication
  - Integrity
  - Replay Protection
- Key Management for SRTP
  - **Using SIP without TLS for delivery is still vulnerable**
  - ZRTP / ZRTP/S provide Diffie-Hellman handshakes
  - MIKEY provides Public Key Encryption

Advanced or basic SRTP/RTP attacks can be used for eavesdropping

- ARP attacks,
- DHCP attacks
- Proxy attacks
- RTP information in the SIP request can be overwritten
- Master key can be extracted from the SDP content in SIP requests

## Hacking VoIP - Decrypting SDES Protected SRTP Phone Calls

<https://www.acritelli.com/hacking-voip-decrypting-sdes-protected-srtp-phone-calls>

- Obtain a complete call, including SIP exchange and RTP data, between two endpoints
- Grab the key and filter out a single SRTP stream in Wireshark
- Use srtp-decrypt (<https://github.com/gteissier/srtp-decrypt>) to decrypt the SRTP
- Replay the decrypted RTP data in Wireshark

## Wireshark can decode and play RTP streams

- Different codecs and two Streams

Wireshark: RTP Streams

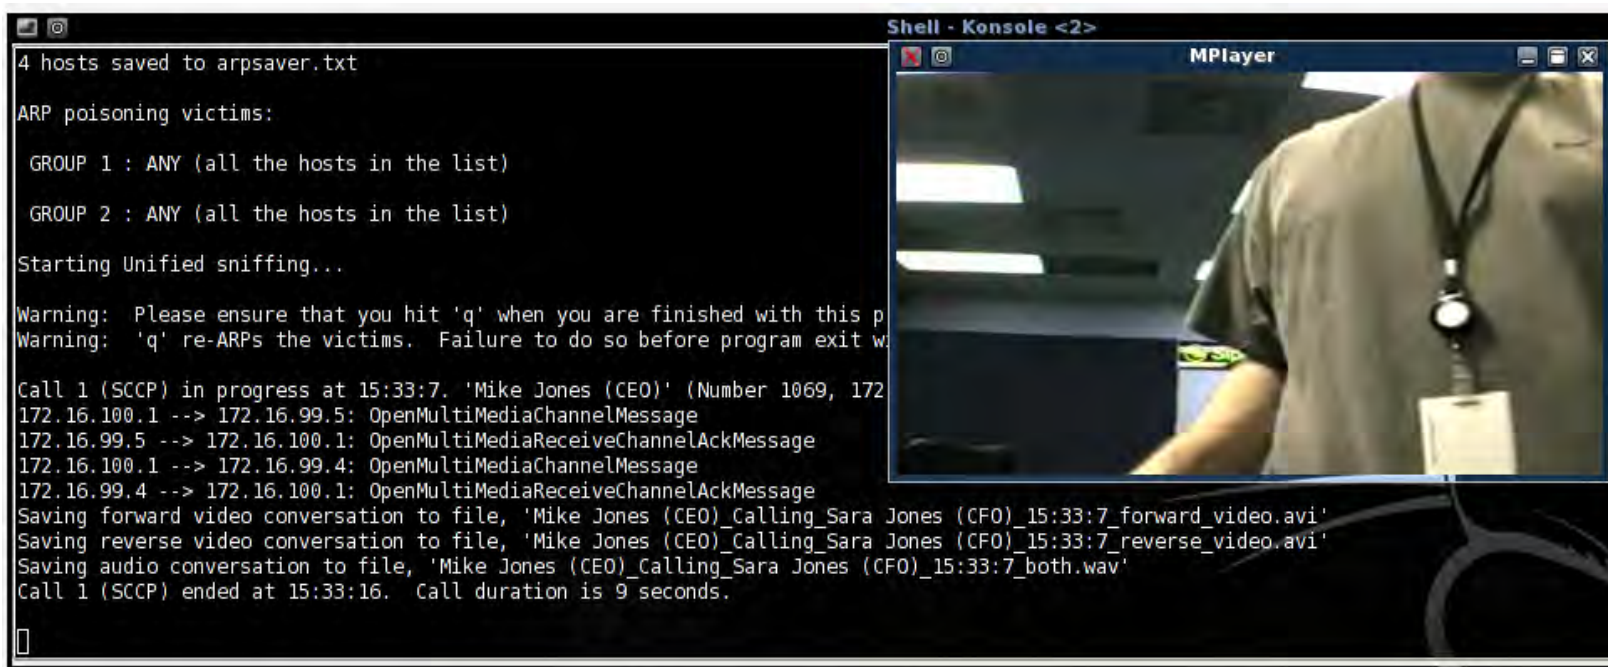

Detected 12 RTP streams. Choose one for forward and reverse direction for analysis

```

- RTP proxies should be in use to
  - Isolate the clients
  - Cover the various client types (PSTN, SIP, 3G/4G)
  - Avoid the client to client direct communication
- SRTP should be implemented
  - Enforce the strong encryption
  - Don't use key management through insecure channels such as SIP without TLS
  - ZRTP or MIKEY (depending on the implementation)

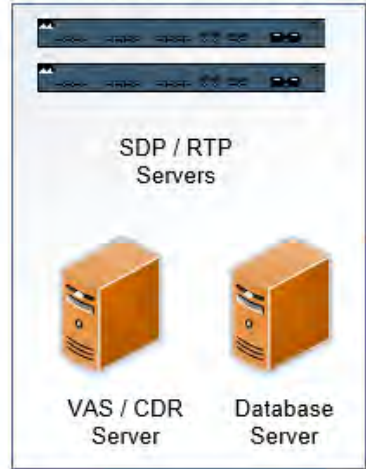

# Cloud VoIP Solutions Security

# Cloud VoIP solutions

### Sandbox for Tenant Services

SIP, RTP, HTTP

SIP, RTP, HTTP

SIP, RTP

### Shared Services for All Tenants

- Vendors are Cisco and VOSS Solutions
- Web based management services
  - IP Phone services (CUCDM [VOSS] IP Phone Services)
  - Tenant client services(CUCDM [VOSS] Selfcare)
  - Tenant\* services (CUCDM [VOSS] Domain Manager)
- VoIP services
  - Skinny (SCCP) services for Cisco phones
  - SIP services for other tenant phones
  - RTP services for media streaming
- PBX/ISDN gateways, network equipment

\* Tenant => Customer of hosted VoIP service

## Plan

- Discovering the cloud services as tenant
- Attacking to the dedicated tenant services
- Attacking to the shared services for tenants
- Jailbreaking the cloud tenant isolation

## Goals

- Call and toll fraud
- Compromising all tenants in the cloud
- Eavesdropping

- Discover VoIP network configuration, design and requirements
- Find Voice VLAN and gain access
- Gain access using PC port on IP Phone
- Understand the switching security for:
  - Main vendor for VoIP infrastructure
  - Network authentication requirements
  - VLAN ID and requirements
  - IP Phone management services
  - Supportive services in use

- Cisco UC Domain Manager
  - VOSS IP Phone XML services
  - VOSS Self Care customer portal
  - VOSS Tenant services management
- Cisco UC Manager
  - Cisco Unified Dialed Number Analyser
  - Cisco Unified Reporting
  - Cisco Unified CM CDR Analysis and Reporting

```

- Engage audits as tenants and could owners
  - Privacy of the tenants vs Toll fraud
- Isolate the tenants for all services
  - No shared services if possible
  - Shared services should be tested for jailbreaking
- Security updates the cloud environment
- Enforce the strong encryption and authentication for tenant phones and services
- Manage the backward compatibility

# VoIP Client Security

- Softphones vs Handsets vs Teleconferencing
- Information Disclosure
  - Unnecessary services and ports (SNMP, echo)
  - Weak management services (telnet, SSH, HTTP)
  - Stored credentials and sensitive information
- Unauthorised Access
  - Password attacks
  - Compromising software using TFTP server
    - Configuration files, upgrade files, firmware
- Weak VoIP Services
  - They may accept direct invite, register or notify

## Plan

- Analysing the VoIP clients in use for the commercial services
- Finding the published and unpublished bugs on the clients
- Trying to exploit those bugs from remote

## Goals

- Mass compromise of clients
- Injecting a persistent backdoor to the clients

- Caller ID spoofed messages
  - to install a malicious application or an SSL certificate
  - to redirect voicemails or calls
- Fake caller ID for Scam, Vishing or Spying
- Manipulate the content or content-type on messaging
  - Trigger a crash/BoF on the remote client
  - Inject cross-site scripting to the conversation
- Proxies with TCP/TLS interception and manipulation
  - Viproxy ([github.com/fozavci/viproxy](https://github.com/fozavci/viproxy))
  - MITMproxy

- We Need a Rogue Service
  - Adding a feature to a regular SIP client
  - Collecting credentials
  - Redirecting calls
  - Manipulating CDR or billing features
  - Fuzzing servers and clients for vulnerabilities
- Rogue Service Should be Semi-Automated
  - Communication sequence should be defined
  - Sending bogus request/result to client/server

- Use ARP/DNS Spoof & VLAN hopping & Manual config
- Collect credentials, hashes, information
- Change client's request to add a feature (eg. Spoofing)
- Change the SDP features to redirect calls
- Add a proxy header to bypass billing & CDR
- Manipulate request at runtime to find BoF vulnerabilities
- Trigger software upgrades for malwarred executables

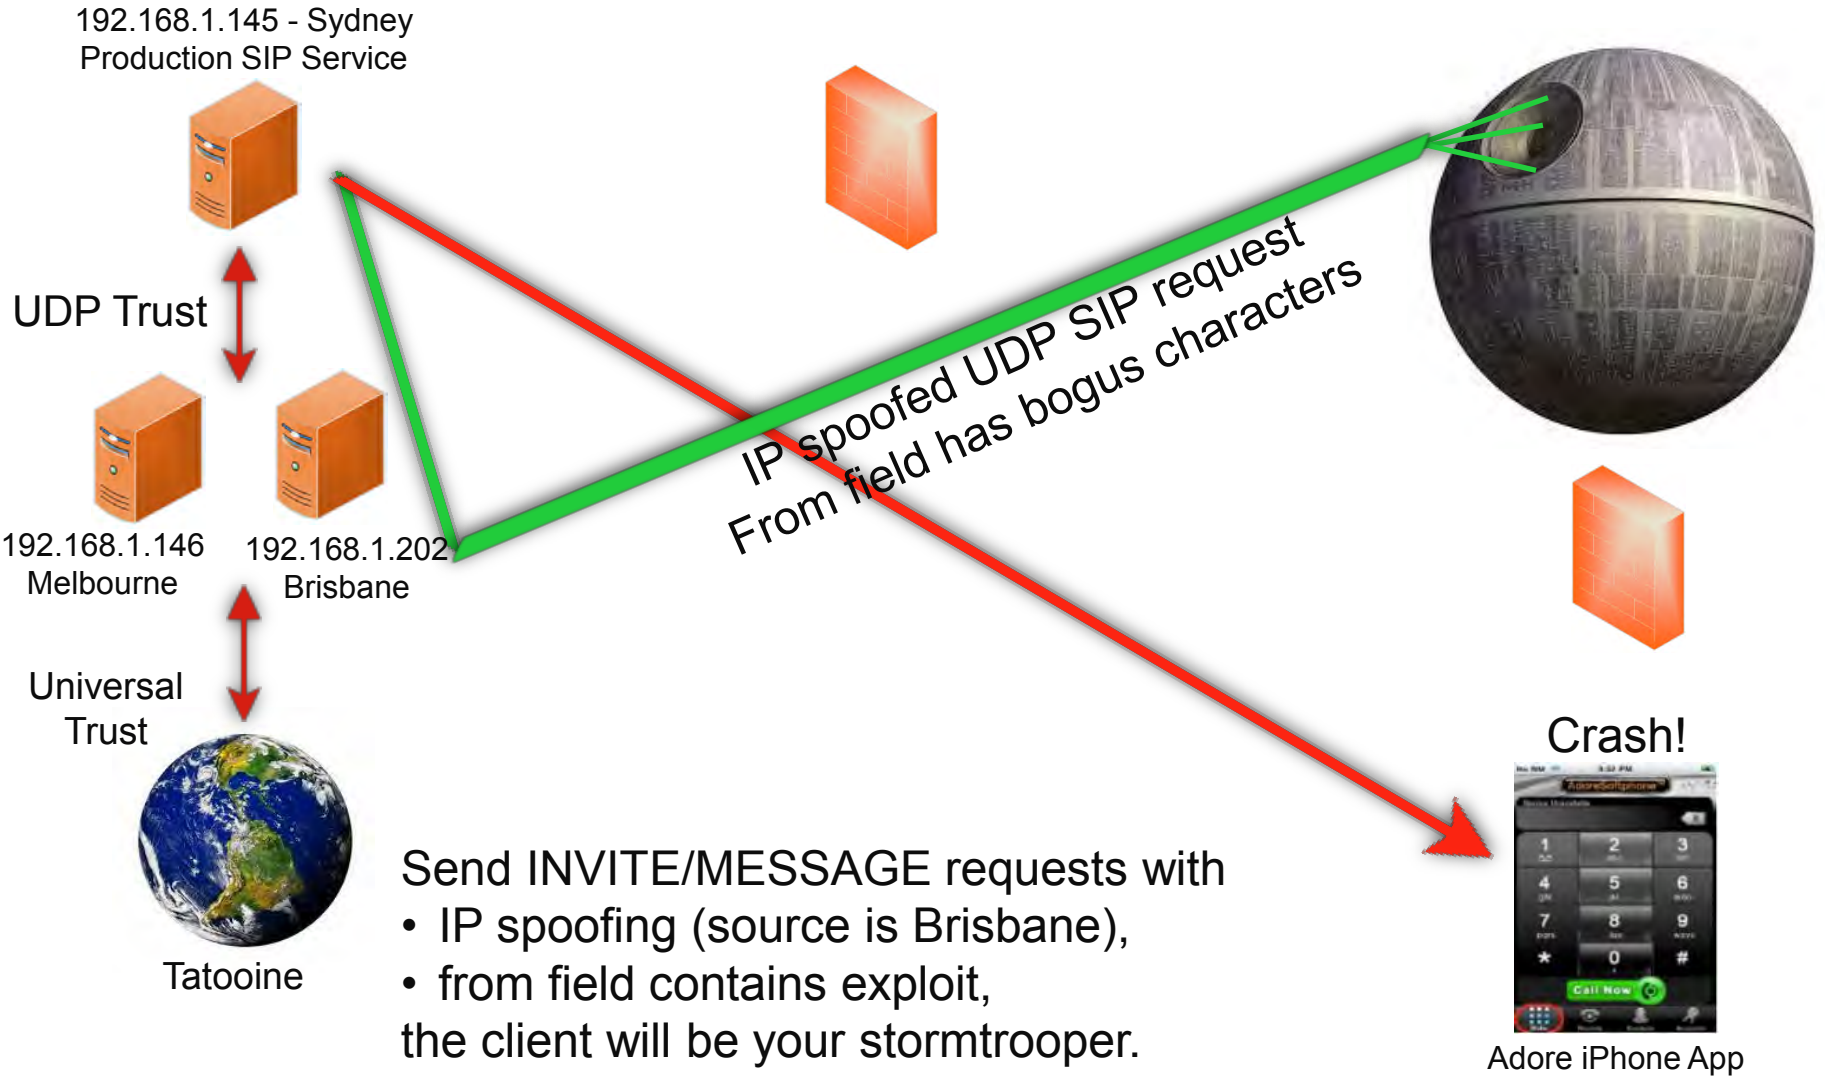

Death Star in the Middle

- SIP server redirects a few fields to client
  - FROM, FROM NAME, Contact
  - Other fields depend on server (e.g. SDP, MIME)
  - Message content
- Clients have buffer overflow in FROM?
  - Send 2000 chars to test it !
  - Crash it or execute your shellcode if available
- Clients trust SIP servers and trust is UDP based
  - Trust hacking module can be used for the trust between server and client too.
- Viproy Penetration Testing Kit SIP Modules
  - Simple fuzz support (FROM=FUZZ 2000)
  - You can modify it for further attacks

# Attacking a client using SIP trust

Send INVITE/MESSAGE requests with

- IP spoofing (source is Brisbane),
- from field contains exploit,

the client will be your stormtrooper.

- Update the client software and handsets
- Secure communication must be enforced
  - Strong authentication
  - Strong encryption
  - Prevent the information disclosure
- Do not use the client data as trusted
  - Input validation must be in place
  - Use the authenticated Identity, not client's one
- Configure clients to reject calls from out world
